GENERATED	DURATION	FRAMES	VIDEO
24 Oct 2026, 15:03 UTC	0.48s	12	1280 x 720

Observed movement

MEASUREMENT	LEFT ELBOW	RIGHT ELBOW
Observed movement range	**36.3°**	**25.1°**
Inside angle range	84.5° to 120.8°	148.0° to 173.2°
Flexion range	59.2° to 95.5°	6.8° to 32.0°
Frames measured	12/12 (100.0%)	11/12 (91.7%)
Data status	Measured	Measured

Flexion over time

Inside angle + flexion = 180°

Inside angle is the visible shoulder-elbow-wrist angle. A straight arm is 180°. Flexion is the bend away from straight, where a straight arm is 0°. For example: 108° inside angle means 72° flexion.

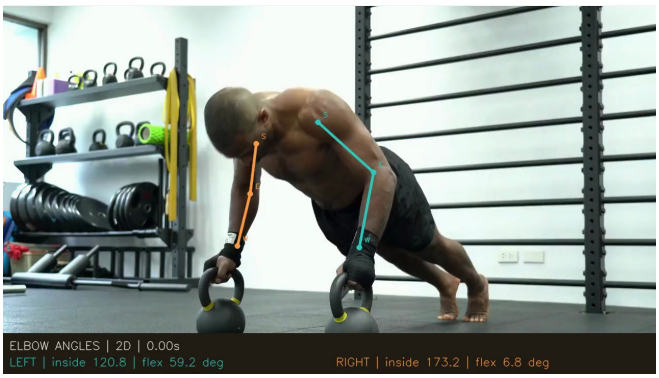

How to interpret the range

Range is the largest minus smallest valid smoothed flexion in this clip, using a 5-frame median. It describes recorded movement, not the full range the person can achieve. Gaps in the graph indicate unavailable measurements.

Frames behind the measurements

Extremes below use the smoothed series. The captions identify each source frame and its current-frame angle estimates.

Left elbow - minimum

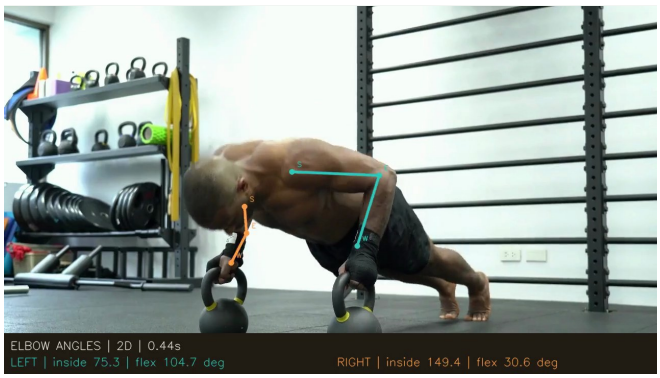

Frame 0 at 0.00s

Inside 120.8° / flexion 59.2°

Smoothed flexion: 59.2°

Left elbow - maximum

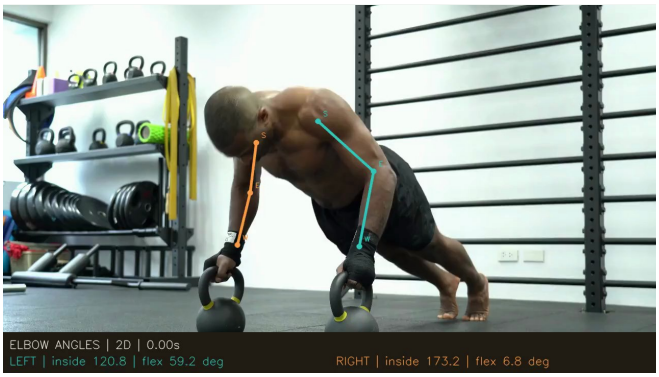

Frame 11 at 0.44s

Inside 75.3° / flexion 104.7°

Smoothed flexion: 95.5°

Right elbow - minimum

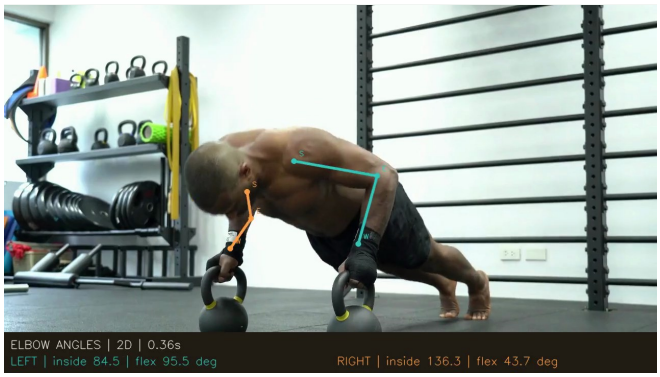

Frame 0 at 0.00s

Inside 173.2° / flexion 6.8°

Smoothed flexion: 6.8°

Right elbow - maximum

Frame 9 at 0.36s

Inside 136.3° / flexion 43.7°

Smoothed flexion: 32.0°

Quality and limitations

Perspective, occlusion, blur and landmark errors can affect estimates. Model confidence is not an accuracy guarantee. This report does not diagnose or grade movement limitations.

Timestamps use frame index / source FPS; variable-frame-rate timing is approximated.
